Times are subject to change due to weather and or Tournaments/Golf Events

What is aerification?

Aerification is the process by which holes are put into the greens to allow for (air) to be able to get into the soil beneath the green. Aerification is needed when the soil beneath the surface of the green becomes compacted.

What is a Needle tine?

Needle tine aerification, also referred to at times as "mini- tine", and/or venting, is aerification that entails the use of small (often 1/4" diameter) solid tines to poke small holes into the green.

What does top dress mean?

Sand topdressing is one of the most important practices for producing smooth putting surfaces and diluting thatch and organic matter. Despite this fact, some courses only apply sand during aeration or infrequently during the golf season to avoid disrupting golfers and dulling mower blades and bedknives.
